Lab Assignment #6

EE-126/COMP-46: Computer Engineering w/lab
Professor: Mark Hempstead **TA:** Parnian Mokri
Tufts University, Fall 2021

Due as per the class calendar, via 'provide'

The ultimate goal of this project is to design a pipelined version of a ARM processor that can detect control and data hazards. The functionality of the processor and its components should match the descriptions in the textbook unless otherwise noted. All work must be your own; copying of code will result in a zero for the project and a report to the administration.

Extra resources

Please refer to LabResourcesTutorials for more resources on using Questasim and VHDL tutorials. If you decide to use halligan's windows machine for your labs, every machine in Halligan Hall **Room 122** has Questasim installed and running. Make sure you save your files in a write-able directory.

List of assignments

- Lab 0: Set up modelsim, simulate an AND gate with 2 inputs and 1 output
- Lab 1: Basic Processor Components and Testbenches
- Lab 2: Remaining Processor Components including ALU, Memories, and control logic
- Lab 3: Implementation LEGv8: a single cycle processor that executes a subset of ARM v8-64bit ISA
- Lab 4: Pipelined processor with no hardware hazard detection
- Lab 5: Overcoming data-hazards using forwaring and stalling
- **Lab 6: Overcoming control hazards by resolving conditional/unconditional branches in ID and using flushing**
- Lab 7: Advanced Topics: open-ended team project (groups up to 2 people)

Lab Submission

Please submit your VHDL files *and* a PDF report via 'provide' command on the EE/CS machines. Please follow the announcement on Canvas about Provide to submit your labs and pay attention to messages you get when you try to provide.
VHDL Files: Submit the VHDL source files **(*.vhd)**[1] and any dependencies thereof. Use the entity descriptions provided at the end of this document.[2] These descriptions can also be found in assignment6.zip.
Scripts/Makefile/README: The course staff needs to know how to compile your code and run your testbenches. Please include a README and/or runscripts/Makefile. In addition, do no change the entitity definitions or it will not run with our tests
Report: Submit your report as a PDF**(*.pdf)**. Demonstrate the functionality of your code by providing waveforms as detailed in the Deliverables Section. Label/annotate important signals and events in your waveforms and then provide a brief description of what is happening.

[1] Do NOT submit your entire Modelsim project (including but not limited to ***.mpf** and files in **work/**)
[2] Submissions that fail to to follow any of these directions may be penalized at the discretion of the grader. If you have questions, contact the TA (Parnian Mokri: parnian.mokri@tufts.edu).

Lab6 Objectives

- Implement PipelinedCPU2: a modified version of PipelinedCPU1 that resolves conditional branches (cbz) and unconditional branches (b) in the **ID stage** as described in *Section 4.8* of the textbook, including the flushing of instruction(s) when required
- You do *not* need to implement logic to handle the "exceptions" on section 4.9 of the textbook
- Demonstrate functionality by running the test program in this assignment.

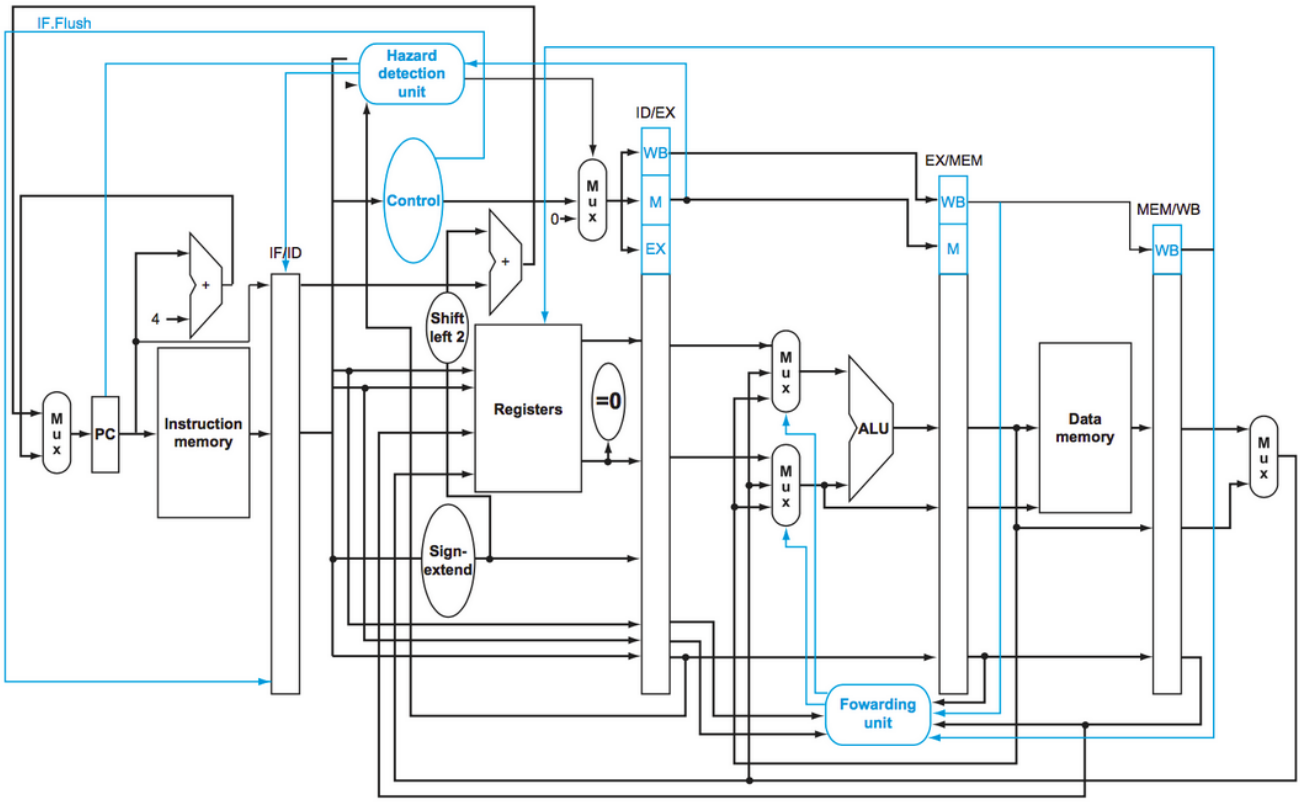

Figure 1: **The final datapath with some of the modifications to resolve control hazards.** The new additions are the IF.Flush signal and the equality test (=) on the outputs of the register file. NOTE: This diagram leaves out details of what additional logic is required and how to connect it. You should implement logic to enable conditional branches(cbz only) and unconditional branches(b only) to complete in the ID stage as described in *Section 4.8* of the textbook. This is Figure (4.64) in the textbook

Deliverables

VHDL Files

PipelinedCPU2 and all of the entities it uses.

Report

Provide waveforms—along with annotations, labels, and descriptions—that show the successful execution of the program defined later in this document. Be sure to:

- Include the most relevant signals in your waveform, including those related to overcoming control hazards
- Point out the following
  - Which instructions are executed, not executed, and which begin execution but are later "flushed"
  - When a conditional/unconditional branches is resolved
  - When/why a branch 'prediction' is correct/incorrect
  - When/why a flush occurs and what its effect is

- Clearly show what pipeline-stage each instruction is in

Program and Simulation Specifications

Test Program (IMEM contents): partial machine code | raw assembly code

```

Register Values

```
$X9  = 0h1     $X19 = 0h1
$X10 = 0h2     $X20 = 0h2
$X11 = 0h4
$X21 = 0x000000008BADF00D
$X12 = 0h8
$X22 = 0x000000008BADF00D
$X23 = 0x0000000000000000
$X24 = 0x0000000000000000
```

DMEM Contents

```
DMEM(0x0)  = 0x00 00 00 09
DMEM(0x8)  = 0x00 00 00 08
DMEM(0xA)  = 0x00 00 00 07
DMEM(0x1A) = 0x00 00 00 06
```

Reset Sequence

Entity Descriptions (provided in assignment6.zip)

Note that there are DEBUG ports again. There are **additional** ports compared to those of PipelinedCPU0 and PipelinedCPU1!

Pipelined CPU2

```
entity PipelinedCPU2 is
port(
     clk :in std_logic;
     rst :in std_logic;
     --Probe ports used for testing
     DEBUG_IF_FLUSH : out std_logic;
     DEBUG_REG_EQUAL : out std_logic;
     -- Forwarding control signals
     DEBUG_FORWARDA : out std_logic_vector(1 downto 0);
     DEBUG_FORWARDB : out std_logic_vector(1 downto 0);
     --The current address (AddressOut from the PC)
     DEBUG_PC : out std_logic_vector(63 downto 0);
     --Value of PC.write_enable
     DEBUG_PC_WRITE_ENABLE : out STD_LOGIC;
     --The current instruction (Instruction output of IMEM)
     DEBUG_INSTRUCTION : out std_logic_vector(31 downto 0);
     --DEBUG ports from other components
     DEBUG_TMP_REGS : out std_logic_vector(64*4 - 1 downto 0);
     DEBUG_SAVED_REGS : out std_logic_vector(64*4 - 1 downto 0);
     DEBUG_MEM_CONTENTS : out std_logic_vector(64*4 - 1 downto 0)
);
end PipelinedCPU2;
```
